

## HEALTH PROFESSIONAL

You are interested in this clinical study ? Before you go any further let me place you in proper context. The father of modern medicine, Louis Pasteur was laughed at ostracized and his medical license was threatened because of his views on sterilization! Where are we today with his now accepted concept?

Even though this is a peer reviewed clinical study conducted under WHO standards the approach is totally different to what Big pharma has to offer.

You will require an open mind; in some instances, will have to make a complete paradigm shift. This clinical trial was conducted on AIDS patients, at the time AIDS was the virus of concern. Where are we today? We have gone through AIDS, SARS, H1N1 the common flu and yes covid 19 just a few in a long list yet to come. No one dies of AIDS; patients die of complications related to a compromised immune system. As of this writing Covid 19 is of concern and I can say with certainty, environment and lifestyle is a bigger concern when addressing the immune function.

Viprox is not a condition specific approach. We will leave this approach to the pharmaceutical industry. Instead, we take a holistic approach by rebalancing the whole organism and regulating the immune function by addressing the three elements necessary to sustain life. We go at the root cause of any condition at the intracellular level. Viprox takes care of the cells which in turn take care of the tissue and their dysfunctionality. Dr. Montagnier the Nobel lariat who isolated the AIDS virus stated in a conference on AIDS you cannot attack the Virus instead you need to address the immune function with antioxidants, proper nutrition, water and hygiene. He described Viprox years after we were awarded our Patents.

If this introduction is too drastic of a change for you then no need to read on but if you are looking for a long-lasting solution for your patients if the current approach did not yield the desired results, if you believe there needs to be drastic changes in our health care system or if you still hold your sacred oath of "Thy shall do no harm" please read on.

Should you have any questions, concerns or you want to discuss the philosophy which let us to the formulation of Viprox please click and we will set up a time for us to discuss the merits of this approach.

Should you inherently see the benefits and want to discuss what we can do for you medical practice, for supplying hospitals or for institutional government needs etc..let me know and within 24 hours we will get back to you in writing to set up an appointment.

Warmest regards

ROBERT GAUTHIER  
PRESIDENT CEO AND FORMULATOR  
CYMCORP INTERNATIONAL INC.

## **AFRICAN NUTRITION STUDY REPORT—SUMMARY OF A NUTRITIONAL APPROACH DESIGNED TO FORTIFY, MAINTAIN FUNCTION AND REVERSAL OF WASTING IN HIV2 PATIENTS LIVING IN WEST AFRICA**

### **“INCREASE IN WEIGHT AND PHASE ANGLE IN TOGO HIV-2 PATIENTS USING VIPROX. OCTOBER 2007.**

**Principal Investigators: B. Deberry, K Anthony, R Gauthier, R Bender, R Alexander, L Lorenzen, Z Wang. Representing University of California Irvine Medical School, Togo Ministry of Health, Nutraxis Group, the New Jersey Institute of Technology and the All Around the World Foundation.”**

### **BACKGROUND**

This is a background report and independent review written by a former US FDA-California Department of Health Investigator (Retired) on the recent clinical validation of trials on West African HIV2-AIDS patients using **Viprox Nutritional Complex (VNC)**. This study was designed, administered and evaluated under World Health Organization HIV Therapy guidelines. The therapy is designed as a nutritional life extension intervention program, appropriate for resource-poor communities with little or no local institutional medical support for HIV2-AIDS populations. The study population had no exposure to anti viral therapies before or during the Viprox trial.

The study objective is, **“To evaluate the effect of Viprox on HIV-2 patients in Togo West Africa for three months. Viprox is a peptide-enzyme delivered with a functional cluster water delivery system complex designed to be a low-cost, non-toxic, nutritional approach to fortify, extend and maintain function and quality of life for HIV-2 patients.”** The summary of clinical data is contained on a power point presentation, while the full review text of the clinical data contributors is available on separate format and awaits journal publication.

It is the opinion of this investigator that VNC has immediate application for reconstructive remedial nutritional therapy protocols designed for severely mal-nourished HIV2-AIDS patients. The therapy seems to be most appropriate for resource-poor communities with little or no local institutional medical support. Safety and efficacy of the West African Study has been shown in the study summary and is being validated by World Health Organization and a number of third party scientists, MD's and public health experts.

### **THE CURRENT NEED IN TOGO, WEST AFRICA**

The current focus is upon the great and immediate need in Africa as outlined in the President's Emergency Plan for AIDS Relief and recently manifested in US funding appropriations for effective containment of the epidemic. The Prime Minister, Health Secretary and the IDH Microfinance Minister of Togo, West Africa, who have seen and evaluated the results of this initial trial, have made a formal written request that Viprox Nutritional Complex be made widely and immediately available to as many HIV-AIDS

patients as possible. The HIV-AIDS infected population of Togo alone is conservatively estimated at 180,000.

In his letter of request for assistance dated January 20, 2008, Prime Minister Kwasse Klutse advised all involved parties that the VNC nutrition program is seen to be a cost-effective approach to returning previously non-functioning HIV-2 patients to work, family and society after less than three months of daily administration of the Viprox Nutritional Complex. The letter on behalf of IDH Micro Finance and Human Development Program, the Secretary of Health and other parties of interest states, in part, that:

- 1—All parties are **“anxious to move the use of Viprox to a much larger scale”** and on **“a very broad use”** in West Africa;
- 2—All parties wish to incorporate **“broad availability”** of Viprox because it restores HIV-2 patients to fully functional status enabling positive economic and social benefits for families, governments and the local economy. **“Once the individual is physically capable, he/she will re-enter the work force in their former vocation or be trained by the IDH Human Development Program in new skills, accompanied by microlending to initiate their new business.”** (this is of particular interest to the West African IDH Microfinance Program);
- 3—**“The Viprox Program is the most successful, low cost approach (to restoring HIV-2 patients to functionality) we have seen”** and most importantly;
- 4—**“We desperately need more Viprox to expand our (HIV-AIDS) health rebuilding program”**.

## **THE ROLE OF FAITH BASED ORGANIZATIONS IN EXPANSION OF THE VIPROX STUDY**

Because the need for the VNC program in Africa is immediate, the All Around the World Foundation (AATWF.ORG) and Associates propose to begin work with Churches to enable the humanitarian intervention that is required. We believe that eventually, the global body of the church (as described in Pastor Warren’s visionary PEACE Plan) is uniquely positioned to enable the church to lead the way for this compassionate life enhancing intervention ministry for HIV-AIDS patients around the world.

We believe this nutritional program can be expanded to meet the Prime Minister’s request as soon as funding becomes available. Unlike antiviral protocols, this approach can be administratively integrated with local churches, medical clinics, schools, communal kitchens, hospitals and humanitarian organizations wherever the Church and its local leaders have ministerial influence and enabling resources. Also, this program may be incorporated with other trials involving anti-viral administration if the hosting study protocol administrator requires a life enhancing-extension component and conditions allow for appropriate cross-waivers of liability.

Clinical studies prove that tangible physiological results (see below) are reported by HIV-2 patients within several weeks and continue with the maintenance of the nutritional

program. In addition, clinical studies show the Viprox Nutritional Complex is safe, non-toxic and inexpensive when compared with pharmaceutical trials (the estimated cost per person per day of Viprox appears, in this study, to be on the order of a typical morning beverage at Starbucks), requires no special medical devices or clinical apparatus and is easily administered orally (twice a day) with no reported side effects.

Many patients fortunate to be selected into pharmaceutical trials are not able to withstand the rigors of these trials due to extreme malnutrition, compounding the wasting of the immune system. This is an important ethical consideration expressed by the National Institutes of Health and investigators concerning anti-viral pharmaceutical testing protocols in Africa. Many HIV2-AIDS patients die due to poor nutritional status and the toxicity of the medications before anti-viral studies can be fully evaluated. The tragedy in these situations is that neither the patient nor the clinical study is well served. In contrast, VNC nutritional program deals primarily with the issue of reversing of physiological, wasting restoration of function and quality of life issues, including return to work and family.

#### TREND ANALYSIS SUMMARY

The study summary (available on power point) shows rapid restoration (beginning within 30 days) of these physiological metrics:

1—Bio-phase angle (90 % increase). This is the most reliable indicator / predictor of survival in HIV-AIDS patients and has been used for many years in conjunction with highly-active retroviral treatments in HIV epidemiology studies.

2—Total Body weight (trend line slopes upward for the 111 surviving patients in the study, an average body weight increase of 6.9 pounds in 3 months).

3—Total Body Water (67% increase)

4—CD-4 Count (trend line slopes upward for the 115 patients in the study).

This investigator is not aware of another study that shows the above evidence for rapid improvement of health and well-being parameters for HIV2-AIDS patients. For this reason, we are advocating that all possible means be explored to expand this nutritional protocol to Togo, West Africa and to other locations as resources become available.

#### EXPANSION FUNDING FOR THE EXPANSION OF VIPROX IN WEST AFRICA:

Currently, no funding exists to expand the program.

## DELIVERY SYSTEM FOR VIPROX:

The primary functional / delivery component for this nutritional therapy (“the Viprox Complex”) is a patented “clustered water solution” whose molecular geometry, energy resonance, dynamic hydration capability and other properties is protected by two US patents and whose efficacy has found application in a number of other clinically-tested, peer reviewed, trials for a variety of physiological disorders. Similar highly-hydrating functional waters have been sold commercially under the VIVO label with pre-market approval from US FDA for over four years. The food-grade nutritional wafer (peptide–enzyme complex) is delivered to the patients orally with the clustered water twice daily.

L. H. Lorenzen is the patent holder and a principal investigator in the Viprox study, performed his undergraduate studies at the University of California Berkeley and graduate studies at Cal State Fullerton and foreign Institutes while a researcher at the University of California Irvine School of Medicine. At about the same time, the study evaluator, David Weston was pursuing an MPH at Berkeley and working for California Department of Health Services and the US Food and Drug Administration working with Pharmaceutical NDA and efficacy reviews near the Berkeley campus. Lorenzen was in process of receiving two US patents on his invention of functional or clustered water. He spent the next 20 years in water research and clinical studies and has been involved in development of a number of applications that promise to have efficacy in delivery of substances at the cellular and molecular level.

A number of peer reviewed studies show the patented clustered waters are delivered or channeled to the cellular level at a rate many times that of distilled water or drinking water. Many of these studies, although well researched, remained relatively obscure and many were not widely published. The science of clustered water as a delivery system for molecular cellular therapies is not yet well known in medical journals.

However, the theory and functionality of Lorenzen’s patents received wide attention in 2003 with the Nobel research by McKinnon and Agree in the chemistry and physics of Water Channeling. The practical applications for enhancement of nutritional and pharmaceutical delivery at the sub-cellular level (as described in their ground breaking research) appear to be very effective and innovative. It is of more than passing interest that Lorenzen was patenting and designing clinical research with his “designed” cluster waters long before the concept of water channeling was introduced or accepted as an explanation of the mechanism of hydration.

Lorenzen recently invited David Weston and Associates to join his team in developing further commercial applications for cluster water solutions and implementing commercial manufacture of solutions premised upon these clustered water patents. Weston has been given access to a number of research papers and clinical research studies on functional water that Lorenzen & Associates have conducted. The efficacy shown in many of the studies under review is most helpful in evaluating role of “functional” or “clustered” water in the subject African HIV2-AIDS study. The range of functional application of

these solutions in nutrition, human performance, reversal of bodily wasting and select symptom reversal, appears to be very far-reaching.

## SUMMARY AND FOLLOW UP

1--We advocate that the Viprox Nutritional Program be made available at the request of the Prime Minister and Secretary of Health of Togo, West Africa as funds and resources become available. It is remarkable that the reversing of the average weight gain in severely-immune compromised, nutritionally deprived HIV2-AIDS patients is 6.9 pounds in 90 days for 115 participants. The nutritional factor alone is worthy of expanding the Viprox program to a much larger level (perhaps as a stand-alone African Nutrition Plan to enhance existing programs sponsored by, for example, the World Food Programme) as enabling resources allow. As the Viprox African Nutrition Plan is designed, funded and implemented, the following steps may be included in the Plan, specific to HIV, Malaria and related interventions.

2--Considering the demonstrated weight gains and reversal of wasting in the latter-stage HIV patients, it would be of extreme interest to study the effects of administration of Viprox to patients with a less-advanced stage of HIV compared to the more-advanced results demonstrated in the initial trial. Establishing the optimal time during the progression of the disease to begin the Viprox Nutritional Program would be of great value as a more comprehensive intervention program is designed and expanded.

3--As the nutritional factors evaluated above become more well understood, it is recommended that the Viprox Nutritional Program be incorporated into a recognized anti-viral trial for the purpose of reversing the bodily wasting trends (demonstrated above) in the trial group, with the hope of increasing / maximizing the amount of time for the anti-viral course and viral load trend to be fully evaluated for efficacy.

4—Should the findings from the above studies show meaningful results, an independent anti-viral protocol using clustered water as a delivery system (with the appropriate double blind distilled water for control) should be considered for design and implementation.

Lee H. Lorenzen  
Cluster Solutions, Inc.  
56 Maxwell  
Irvine, CA 92618

Dear Lee:

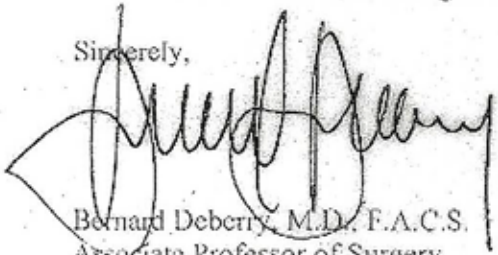

I have reviewed the summary report by Kodjo Akpenyo Anthony, M.D., M.P.H. regarding the clinical test of the peptide/triozyme enzyme/cluster water complex (the Complex) in Togo, West Africa AIDS patients. The report describes the results of a 3 month double blind study on 115 HIV-2 positive patients who were divided into 2 groups, with roughly half consuming placebo.

The study concluded that patients receiving the Complex have significantly improved in the parameters of general health, hepatic function, renal function, and immune system defense capacity. The study notes a mild drop in hemoglobin values from 11.6 to 11.1 in the Lome patients and 11.8 to 11.1 in the Agou patients. It is my opinion that the most likely explanation of this observation is relative hemodilution created by improved hydration from the clustered water.

As a faculty member of the University of California Irvine School of Medicine, I am always interested in nontoxic, affordable approaches to addressing serious public health issues. The Complex appears to hold great promise in improving the quality of life of AIDS patients and further research should be aggressively pursued to ascertain if the Complex may significantly slow or arrest the progression of the disease.

I applaud Prime Minister Klutse, Robert Gauthier, Dr. Kodjo Akpenyo Anthony, Dr. Robert Bender, Brian Hovey and you for your continued efforts to find inexpensive but effective methods of addressing a world wide health crisis.

Sincerely,

Bernard Deberry, M.D., F.A.C.S.

| 6 Health workers<br>(2 workers per site) | Auxiliaries for the preparation and distribution of products                       |

## **I - INTRODUCTION**

For many decades, the Togolese state, highly concerned with the welfare of her citizens and acknowledging the importance of health as a factor of productivity, has made Health one of her priorities: “Health For All and All For Health”.

HIV/AIDS is one of the deadly diseases plaguing the nation calling for the mobilization of efforts to fight it and to provide care and support for people living with the HIV/AIDS disease.

The average **HIV** prevalent infection rate among the adult population rose from 5% in 1995 to over 6% in 1998 (according to PNLS source) but dropped below 4% in 2006.

The disease affects all the regions in Togo; however, the urban areas are relatively more vulnerable. In 82.8% cases the transmission of the disease is heterosexual. The mother-to-child transmission accounts for 6.5% of the cases.

## **II - CONTEXT AND JUSTIFICATIONS**

HIV/AIDS infection is rising in exponential proportion in spite of the noticeable efforts being deployed to prevent the transmission of the virus and to provide care and support for persons infected by HIV virus.

Africa pays the heaviest toll for this pandemic; over a total of 40 million people infected by the HIV in December 2001 throughout the world, 28.1 million, representing 70% of the total number live in the sub-Saharan region of Africa.

Developing countries account for over 95% of the 14,000 new cases occurring everyday.

### **HIV/AIDS in TOGO:**

In Togo, the HIV epidemic is of the mature type and generalized; the prevalence among the general population is 4.2% in 2006 with a high rate of AIDS-orphaned children.

Women constitute the most vulnerable target of HIV. From 4.2% in 1985, the sex ratio dropped to 1.1 in 2000. This female vulnerability to HIV infection has many reasons: women’s biological constitution and their socio-cultural and economic conditions.

According to the data collected by the National HIV/AIDS PREVENTION PROGRAM from sentinel sites for the surveillance of the epidemic at the regression period show that the prevalence rate was 4.7% in 2003, 4.5% in 2004 and 4.2% in 2006. The HIV epidemic is getting stabilised in Togo thereby concealing major differences in the regions as well as within the populations.

.

On the basis of the analysis of the data collected from the sentinel sites among the target populations such as sex workers and their customers, blood donors, the UN experts on the surveillance of HIV/AIDS and STI reckoned HIV prevalence in Togo to be 3.2% in 2005 among the sexually active population of the 15- 49- year- olds. These data range from 1.9 to 4.7 representing the gap mark. The study carried out in 2005 by AIDS3 with the help of the Canadian cooperation among sex workers in Lome revealed a prevalence of 44.5%.

On the basis of the present prevalence of 3.2% it was noted that 110,000 adults and children lived with HIV; 9,700 children from 0 to 14 years old lived with HIV; 9,100 adults and children died of AIDS; the epidemic rendered orphan 88,000 children from 0 to 17 years.(period).

In September 2006 ending the number of people living with HIV who benefited from the total care and support including the ARV was 5,300 out of a target population of 15,000 persons from now to year 2010.

In this respect the national strategy was in line with the universal access to prevention, treatment, care and support services. It emphasized prevention of new infections, treatment of people living with HIV by ARV and medicines for opportunistic infections, care and support to infected and affected persons.

The coverage rate of mother-child prevention and transmission (MCPT) was 11.1% in 2006 in the 34 sites spreading over the 14 districts that were covered. This low rate is the result of difficulties of access to mother-child prevention and transmission services. Up to 2006, out of 65,455 pregnant women admitted to CPN (Pre-natal Consultation), 58,693 benefited from free tests, counseling; 35,130 were tested for HIV; 1,794 HIV-positive women received Nevirapine treatment and 1,038 delivered after taking the Nevirapine; 159 received ARV treatment; 1,144 children were born of HIV-positive mothers; 1,077 children received Nevirapine syrup treatment; after testing 104 children aged 18 months, 81 were found negative, i.e.78%; 1,021 children were treated with Cotrimoxazol; pregnant women partners accepted to be tested and 24.4% were found HIV-positive.

In spite of efforts made to combat the disease, the virus on account of its multiple mutations remains out of control.

This calls for new researches and mechanisms of treatment to enable the immune system to combat or control this aggressive disease.

In 1994 J.A. Levy one of the first researchers involved in the studies to isolate the AIDS virus and member of the Department of Medicine and Cancer Research Institute of the University of California, San Francisco, expressing his personal view said, “The secret of controlling HIV/AIDS resides not in the medicines which directly attack the virus, but in the body’s own defence mechanism.

By strengthening the body’s immune system the HIV-positive can avoid the attacks of the disease for some decades and probably until their natural death.

The aim of our survey is to assess the effects of VIPROX on the health of people infected with HIV/AIDS.

### **III- Research Hypothesis**

The health condition of HIV/AIDS patients was considerably improved by taking VIPXOX<sup>TM</sup>: the combination of (GSH COMPLEX®), STRUCTURED WATER (VIVO<sup>TM</sup>) and TRIOSYME<sup>TM</sup>.

**GSH COMPLEX®**: substrate which helps in Glutathione intracellular production.

**VIVO<sup>TM</sup>**: structured water which helps in intracellular conductivity.

**TRIOSYME**<sup>TM</sup>: enzyme complex which helps in the assimilation of vitamins and minerals.

## **IV – OBJECTIVES**

### **4.1 General Objective**

To assess the effect of VIPROX on the health of people infected with HIV/AIDS over a period of 3 months.

### **4.2 Specific Objectives**

1. To describe the profile of the sample of study
2. To assess the initial and monthly anthropometric measurements of patients
3. To assess the initial and monthly biological constants of patients
4. To analyze the results
5. To draw conclusions
6. to make suggestions and recommendations to various partners

### **4.3 STRATEGY**

The strategy used, is an experimental study, a randomized double-blind clinical test with a controlled placebo on half of the sample for a period of one month. This strategy involved active practicing partners on the field in providing psychosocial and clinical care for persons living with HIV.

This implies involving those partners in taking care of persons living with HIV through the introduction of VIPROX for a period of three months.

The total cost of the biological tests was borne by the project budget. A particular incentive was given to the patients selected to make good transport expenses so that these products could be taken under the supervision of the care providers.

### **4.4 Care and Support and nutraceutical product Management:**

#### **Patients' Care and Support:**

The care and support for patients organized on a global basis involved their follow up in their homes. The procedures used tallied with the general procedures proposed by the Kpalime National Workshop on the Care and Support for Persons Living with HIV, viz. a prior diagnostic confirmation by a laboratory test.

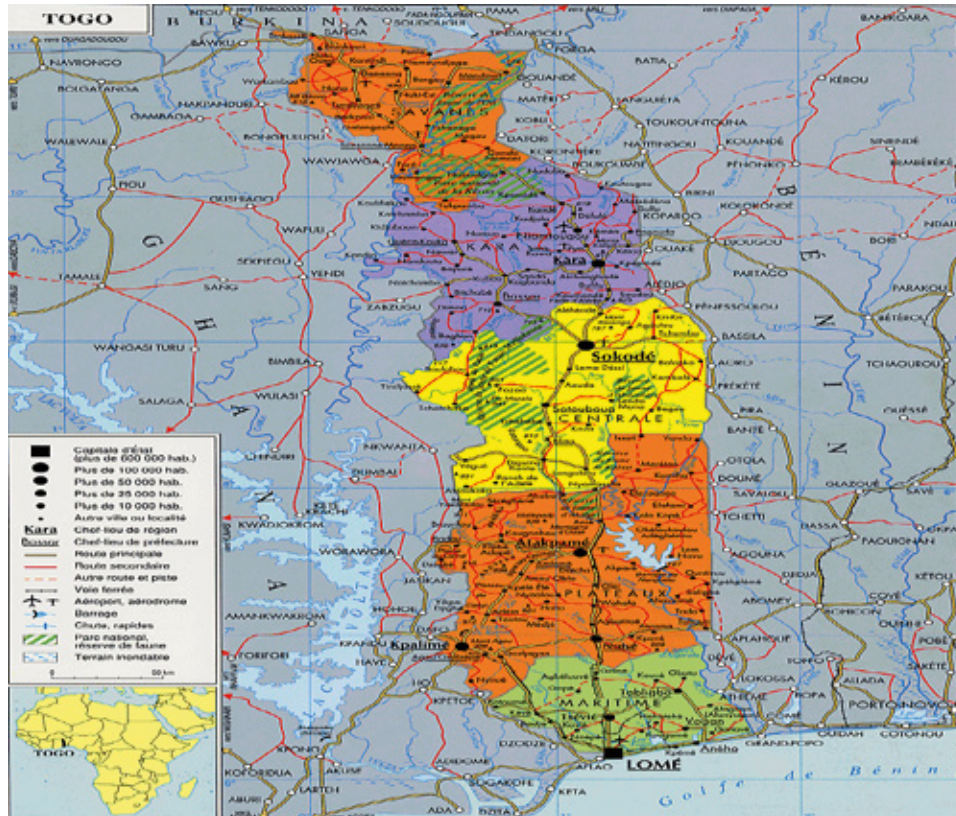

An initial general medical check up comprising as a rule, blood formula numeracy, CD4, and the other laboratory tests if possible.

#### **Nutraceutical product Management**

Each of the selected field partners received a take-off stock of VIPROX and a subsequent stock is supplied by IDH NGO.

## V. FRAMEWORK OF THE SURVEY

## MAP OF THE ADMINISTRATIVE SET UP OF TOGO

## 5.1 OVERVIEW OF TOGO

Togo is a narrow strip of land situated in West Africa in the Gulf of Guinea. It stretches over 600 km lengthwise and its width varies between 50 and 150 km. It is limited on the north by Burkina Faso, on the south by the Atlantic Ocean, on the east by Benin and on the west by Ghana.

## 5.2 Presentation of the Togolese Health Sector

### 5.2.1 Organization of the Togolese Health System

The health sector is organized on a three-tier-pyramidal system.

- *The Central Tier.*

The administrative structure of this tier comprises the Ministry, a general directorate, 5 central directorates, 5 divisions and 39 central services and various programs.

Regarding health service delivery, there are 300 University Teaching Hospitals as well as national institutions such as the National Institute of Hygiene, the National Blood Transfusion Center constituting the major national health delivery system.

- **The Intermediate or Regional Tier**

This is made up of 6 regional directorates:

The Lome Commune, the Maritime Region, the Plateau Region, the Central Region, the Kara Region, the Savannah Region and 6 regional central hospitals which constitute the second major health delivery system;

- **The Peripheral or District Health Delivery Centre**

This tier comprises 35 district health delivery centres including public hospitals, mission hospitals, health centres and private clinics and offices

As a matter of the district and mission hospitals represent the first reference centres but often they are the first contact centres for the beneficiaries of the delivery service

## **5.2.2 Health Delivery Infrastructures**

There are 618 public and mission health delivery services of all kinds including 3 University Teaching Hospitals, 6 Regional Hospitals, 2 specialized hospitals, 25 district hospitals, 9 private/mission hospitals and about 573 peripheral health delivery units composed of polyclinic, health delivery centres, infirmaries and mother-child protection centres.

There are about 236 private clinics and offices 90% of which are found in the Lome Commune.

In spite of all these health delivery infrastructures, the health coverage rate still remains low as a result of the population growth and development of settlement areas.

Access to peripheral health delivery units within a range of 5km is reckoned at 88% according to AS/SR 2003.

## **5.2.3 Human Resources**

In 2004 the public health sector comprised 7,459 staff of all categories working in the administration and health delivery centres including military hospitals. Now in 2005 ending it comprised only 6,953.

From a medical viewpoint, the ARV was accessible to 5,400 persons living with HIV through state funding and by the agency of the World Fund as well as the Essential Generic Purchase Centre i.e.30% of the overall needs involving 18,000 persons.

Twenty (20) health delivery structures and NGO/Associations were regularly supplied with medicines for opportunistic diseases.

## **5.2.4 PTME (Prevention of Mother-Child Transmission)**

The number and of tested pregnant women and their follow up as well as the care and follow up of children has improved thanks to integrated plans put in place in 10 districts, the regular supply of ARV and medicines to combat opportunistic infectious diseases and laboratory equipment, the increase in the number of sites (Prevention of Mother-Child Transmission) from 16 to 34 by their rehabilitation and the supervision of the activities.

## 6. METHODOLOGY

### 6.1 Type of Survey

A randomized double-blind clinical test with placebo was carried out for a one-month period using half of the sample.

Target Population: HIV/AIDS patients selected and followed up according to precise criteria in one urban area and 2 rural areas.

### 6.2 Definition and Measurement of Variables

The Patient's general health condition.

This is measured with respect to the following variables: temperature, weight and blood pressure

The function of the defence system of the body

This is measured with respect to the following variables: the number of red corpuscles, the haemoglobin rate, the number of white corpuscles and the lymphocyte rate.

The Hepatic Function

This is measured with respect to the following variables: transaminases, glycaemia, triglycerides and cholesterol.

The Kidney Function

This measured with respect to the following variable: Creatinine

### TABLE OF THE VARIABLES

| VARIABLES            | NORMS               | MESURE UNITS                            |
|----------------------|---------------------|-----------------------------------------|
| T° : Temperature     | 36°.6 – 37°         | Degree centigrade                       |
| Weights              | 45kg plus           | Kilogramme                              |
| B.P (Blood Pressure) | 13/8                | Hg (mm of mercury)                      |
| Red Corpuscles       | 4500 000 – 5500 000 | N° Corpuscles /mm <sup>3</sup> of blood |
| Haemoglobine Rate    | 12.5 – 15           | g/mml                                   |
| White Corpuscles     | 5000 – 10 000       | N° Corpuscles /mm <sup>3</sup> of blood |
| Lymphocytes Rate     | 20 – 40             | %                                       |
| Transaminase         |                     |                                         |
| SGOT                 | 12 -20              | mUI/ml                                  |
| SGPT                 | 12 - 25             | mUI/ml                                  |
| Glycemia             | 0.8 - 1             | g/liter of blood                        |
| Triglycerides        | 0.4 – 1.4           | g/liter of blood                        |
| Cholesterol          | 1.3 – 3             | g/liter of blood                        |
| Creatinine           | 6 – 12              | Mg/l of blood                           |

### **6.3 Patient Selection Criteria**

We selected in one urban area and one rural a group of HIV infected persons (aged 18 – 45) whose CD4 rate was above 150 and who weighed between 55 and 75kg. These patients were consulted and selected according to the following exclusion criteria:

- Patients with liver disorders.
- Alcoholic patients
- Medically dependent patients
- Patients undergoing anti-AIDS treatment (ARV)
- Milk protein-allergic persons
- Person undergoing immuno-depressant treatment

### **6.4 Target Population and Sampling**

The target population which was selected in three sites (Kodjoviakope, Kouve and Agou) comprised HIV-positive persons of either sex according to the above mentioned criteria.

The sampling which was done at random was based on exclusion criteria.

On account of the variation of rate of HIV-prevalence from one region to another we opted for the selection of the maximum number representing 5% (p)

After making good the number of withdrawals during the survey period, we found thereby, on the basis of our calculations, 82 patients. This figure was raised to 115 to further minimize sampling errors.

In all our study involved 115 HIV persons.

In recruiting the HIV persons for the survey we took into account the gender approach, thus 58 women and 57 men were selected.(see table above).

### **6.5 Intervention**

#### **First Month:**

##### **Group N° 1:**

The selected HIV persons received placebos having similar physical properties as the other products except that they were not active.

##### **Group N° 2:**

Members of this group received active products:

- Active proteins (GSH Complex) 20g x 2 a day for one month.

- 500 ml of structured water for the preparation of active protein.
- 2g of enzyme complex twice a day during meals.

These two groups were formed by a random selection by lot.

### **2<sup>nd</sup> and 3<sup>rd</sup> Months**

At this time all the patients were subjected to active products.

#### **6.6 Duration (3months):**

The first phase of the survey consisted in writing the protocol, designing the data collection cards, training the interviewers.

The second phase consisted in data gathering and patient follow up.

The third phase consisted in data analysis.

#### **6.7 Data Gathering**

The data were collected by means of questionnaire coupled with an observation grid.

The data to be collected concerned clinical and para-clinical information items on the individual files of the patients namely the above-mentioned variables.

#### **6.8 Data Management**

The keying of the data was done by means of Epi Data and their analysis with SPSS 11 software.

#### **6.9 Ethical Issues**

A prior written permit was obtained from the ministries concerned.

Similarly a prior consent was obtained from each patient involved in the survey after the whole thing was explained to them.

These patients were assured that they would have a free supply of VIPROX during and after the survey.

The total cost of transport expenses and daily allowance was guaranteed for the patients selected for the survey.

The publishing of the findings of the survey was subject to the approval of the Medical Ethics Committee.

### **7. Difficulties Encountered:**

Difficulties related to:

- sampling

The number of patients in each site raised many problems. As a matter of fact, in recruiting patients with CD4 above 150, it was necessary to test more than 100 patients per site, which the

initial budget did not provide for. And as a result the survey could not take off according schedule and the beginning of the intake of the products was in three stages.

- duration of the survey

The duration of the survey was extended on account of the different periods when the patients started taking the products.

The failure of patient to turn up for the laboratory tests.

## **8. FINDINGS**

### **Kodjoviakope Site**

#### **a) General Health Status of Patient:**

This was assessed with respect to the following variables (weight, temperature and blood pressure).

We observed a net increase in the average weight of the patients as they took the products (66.8kg to 67.5kg).

The average temperature of the patients was within the norms (37.3 ° to 37.6°).

The average blood pressure of the patients was within the norms (85% of the patients regained their normal blood pressure after three months' treatment).

From these we could conclude that the general health status of the patients was normal.

#### **b) Function of the Body Defence System**

After the patients had taking the product for 3 months, a net increase was observed in the average CD4 (ranging from 347 to 359).

However, there was a slight fall in the number of red corpuscles resulting in a slight anaemia with an average rate of haemoglobin ranging from 11.6% to 11.1%.

A further slight increase was found at the leucocytes side ranging from 4,770 to 4,855 with an average lymphocyte percentage rise ranging from 55.4% to 57%.

It was found that an improvement of the patients' body defence system was under way.

#### **c) Function of the Hepatic System**

The average transaminases and SGOT and average SGPT decreased in number indicating an improvement of this variable ( 50.4 IU/L to 40.8 IU/L).

The median glycaemia was falling showing an improvement from 0.9g/l to 0.87 g/l.

The triglycerides also were falling from 0.9g/l to 0.7g/l.

There was also a fall in the blood cholesterol level from 1.6g/l to 1.5g/l.

It was found that the hepatic system was getting normal.

#### **d) Function of the Kidney System**

The average creatinine dropped from 9.7mg/l to 9.1mg/l.

The kidney system reached normal values (7mg/l – 12mg/l).

### **CONCLUSION**

One could conclude that the patients' general health status had improved as there was an improvement in their hepatic, kidney and defence systems.

#### **The Agou Site**

##### **a) General Health Status of the Patients:**

As a net increase in the patients' average weight was observed in the case of the Kodjoviakope site, there was a net increase in the patients' average weight (54 kg to 56.9 kg) as they took the products.

The patients' average temperatures reached normal values (36.7° to 36.8°).

The average blood pressure also reached normal values.

After three months' treatment the patients' weight increased considerably.

As a matter of fact, after three months' treatment the initial average weight which was 55kg, reached nearly 57kg.

It was found that the patients' general health status was normal.

##### **b) Function of the Body Defence System**

After the patients had taken the products for three months, there was a change in the average CD4 (from 420 to 458 then to 374).

There was a slight fall in the number of red corpuscles resulting in a slight anaemia with an average rate of haemoglobin ranging from 11.8% to 11.1%.

A further slight increase was found at the leucocytes side ranging 4,582 to 4,247 with an average lymphocyte percentage rise ranging from 49.9% to 51.9%.

It was found that an improvement of the patients' body defence system was under way.

### **c) Function of the Hepatic System**

The average transaminases and SGOT and average SGPT decreased in number signalling an improvement of this variable (30.4 IU/L to 24.1 IU/L).

The median glycaemia was falling showing an improvement from 0.9g/l to 0.87 g/l.

The triglycerides also reached normal values 0.6g/l to 0.7g/l.

There was also a fall in the blood cholesterol level from 1g/l to 0.9g/l.

It was found that the hepatic system was getting normal.

### **e) Function of the Kidney System**

The average creatinine dropped from 9.4mg/l to 8.4mg/l.

The kidney system reached normal values (7mg/l – 12mg/l).

## **CONCLUSION**

One could conclude that the patients' general health status had improved.

There was an improvement in the patients' hepatic, kidney and defence systems

### **The Kouve Site**

#### **a) General Health Status of the Patients:**

This assessed with respect to the following variables: (weight, temperature, blood pressure).

There was an increase in the patients' average weight as they took the products (54.42 kg to 58.26 kg).

The patients' average temperatures reached normal values (36.9° to 37.02°).

The average blood pressure also reached normal values.

It was found that the patients' general health status was normal.

#### **b) Function of the Body Defence System**

After the patients had taken the products for three months, the average CD4 increased considerably (from 312 to 370).

However, there was a slight fall in the number of red corpuscles resulting in a slight anaemia with an average haemoglobin rate ranging from 11.7% to 12.145%.

A further slight increase was observed at the leucocytes side ranging 5,853 to 5,932 with an average lymphocyte percentage rise ranging from 36.34% to 44.70%.

It was found that an improvement of the patients' body defence system was under way.

### **c) Function of the Hepatic System**

The average transaminases and SGOT and average SGPT increased in number indicating a change in this system( 34 IU/L to 40 IU/L).

The median glycaemia got stabilized.

The average triglycerides also dropped from 1.5g/l to 0.82g/l.

There also a slight rise in the blood cholesterol level (from 0.95g/l to 1.38g/l.)

It was found that the hepatic system was getting slightly bad. It must be noted that that area is known for the consumption of locally distilled alcohol.

### **d)Function of the Kidney System**

The average creatinine went up slightly from 8.52mg/l to 9.09mg/l.

The kidney system reached normal values (7mg/l – 12mg/l).

## **CONCLUSION**

In the case of Kouve site one could conclude that the patients' general health status had undergone a slight improvement; however, it is to be noted that the hepatic and kidney systems had gone slightly bad. This may be due to regular consumption of locally distilled alcohol, which characterizes the drinking habit of the local people.

## **9. GENERAL CONCLUSION**

The comparative analysis of the data collected was made by the Levene and T-test to ensure average equality.

The Levene variance equality test and the average equality T-test ensured the strength of the comparisons of the biological constants levels during the three months' treatment with active product.

The analysis showed that the average constant variations of the functions of the patients' general health status (Weight, T°, BP) representing a threshold of 99% was statistically significant.

As regards the other functions of the kidney and body defence systems, it was further noticed that there was a statistically significant difference between the months of treatment (M0 to M3) according to the average equality T-test. Thus one can conclude without great risk (1%) that the improvement is due to the treatments received by the patients.

Lome, 11<sup>th</sup> October 2007

Dr Kodjo Akpenyo ANTHONY M D; M P H

In-charge of the Survey

# **ANNEXES**

# FINDINGS

The findings of the survey are as follows:

- 1- Description of initial sample
- 2- Analysis of the findings per site and variables after three months' treatment.

## I- Initial Information

**Table 1 : Distribution of patients according to sites and age**

The patients used in survey are generally aged between 20 and 49 years (94.8% at Kodjoviakopé and 84.2% at Agou).

This age group is the most sexually active.

| ÂGE OF PATIENTS | LOMÉ COMMUNE (Kodjoviakopé) |       | PLATEAUX RÉGION (AGOU) |       |
|-----------------|-----------------------------|-------|------------------------|-------|
|                 | n                           | %     | n                      | %     |
| 18-19 years     | 1                           | 2.6   | 0                      | 0.0   |
| 20-29 years     | 7                           | 17.9  | 7                      | 18.4  |
| 30-39 years     | 24                          | 61.5  | 15                     | 39.5  |
| 40-49 years     | 6                           | 15.4  | 10                     | 26.3  |
| 50 years +      | 1                           | 2.6   | 6                      | 15.8  |
| Total           | 39                          | 100.0 | 38                     | 100.0 |

**Table 2 : Distribution of patients according to site and sex**

At Agou 50% of the patients were men and women and at Kodjoviakope the per ratio of men to women was 18: 82.

| SEX       | LOMÉ COMMUNE<br>(Kodjoviakope) |       | PLATEAUX RÉGION (AGOU) |       |
|-----------|--------------------------------|-------|------------------------|-------|
|           | n                              | %     | n                      | %     |

## THE FINDINGS FROM THE FIRST MONTH TO THE THIRD MONTH

### LOME COMMUNE (Kodjoviakope)

**General health status of the patients :** This was assessed with respect to the following variables (Weight, T°, and B/P)

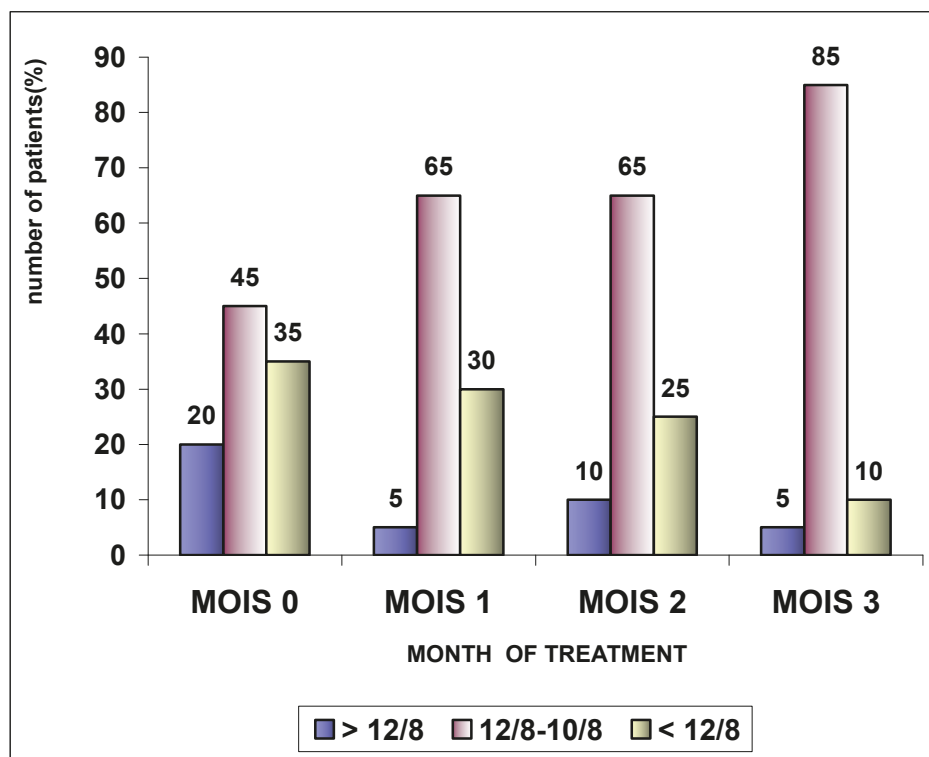

A net improvement was noticed in the average weight of the patients as they took the products (66.8kg to 67.5kg).

The patients' average temperature was within the norms (37.3° to 37.6°)

**It may be concluded that the general health conditions are normal.**

|                         | MARK GAP   | 0.4                | 0.2     | 0.3     | 0.5      |

### Changes in the blood pressure during the treatment period (Lome- Commune)

The blood pressure showed a net improvement after 3 months' treatment; patients with blood pressure ranging from 12/8 – 10/8 accounted for only 45% at the beginning of the treatment.

After 3 months' treatment more than 85% of the patients regained their normal blood pressure.

According to Levene Test, this change at the threshold of 99% was significant from statistical point of view.

### ***Defence function of the body***

*After the patients had taken the products for 3 months, there was a net improvement in the average CD4 (from 347 to 359).*

*However, there was a slight drop in the number of red corpuscles resulting in the patients having a slight anaemia with an average haemoglobin rate of 11.6% to 11.1%.*

*A slight increase was also noticed in the number of leucocytes from (4770 to 4855 with an average percentage rise in the lymphocytes also, 55.4% to 57%.*

***It may be concluded that an improvement in the patients' body defence systems was under way.***

### ***Function of the hepatic system***

*The average transaminases SGOT and SGPT decreased showing an improvement of this variable, 50.4 IU /L to 40.8 IU/L.*

The patients' median glycaemia dropped showing an improvement of this constant, from 0.9g/l to 0.87g/l).

The average triglycerides also dropped, from 0.9g/l 0.7g/.

The blood cholesterol level also dropped, from 1g/l to 0.9g/l)

***It may be concluded that the hepatic system was getting normal.***

## **CONCLUSION**

**On the whole, it may be concluded that the patients general health conditions were getting improved.**

**The patients' hepatic, kidney and body defence system had improved.**

## AGOU

**General health status of the patients :** This was assessed with respect to the following variables (Weight,  $T^{\circ}$ , and B/P)

A net improvement was noticed in the average weight of the patients as they took the products (66.8kg to 67.5kg).

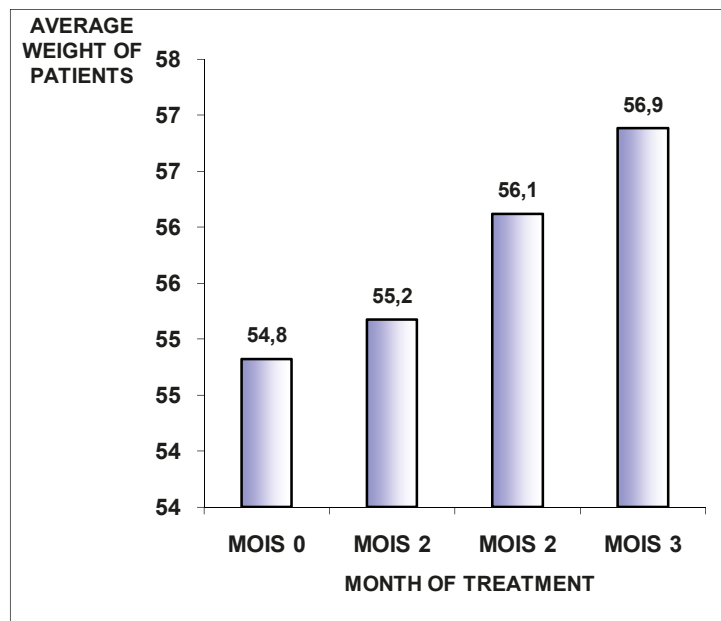

The patients' average temperature was within the norms ( $37.3^{\circ}$  to  $37.6^{\circ}$ )

The average blood pressure was also within the norms.

**It may be concluded that the general health conditions were normal.**

## Changes in the patients' weights during the treatment period

After 3 months' treatment there was a net increase in the patients' weights from an initial average weight of 55kg to nearly 57kg.

### ***Defence function of the body***

*After the patients had taken the products for 3 months, there was a net improvement in the average CD4 (from 420 to 458 then to 374).*

*However, there was a slight drop in the number of red corpuscles resulting in the patients having a slight anaemia with an average haemoglobin rate of 11.8% to 11.1%.*

*A slight increase was also noticed in the number of leucocytes from (4582 to 4247 with an average percentage rise in the lymphocytes also, 49.9% to 51.9%.*

***It may be concluded that an improvement in the patients' body defence systems was under way.***

### **KOUVE**

#### **General Health Status of the Patients:**

This was assessed with respect to the following variables: (weight, temperature, blood pressure).

There was an increase in the patients' average weight as they took the products (54.42 kg to 58.26 kg).

The patients' average temperatures reached normal values (36.9° to 37.02°).

The average blood pressure also reached normal values.

It was found that the patients' general health status was normal.

### Function of the Body Defence System

After the patients had taken the products for three months, the average CD4 increased considerably (from 312 to 370).

However, there was a slight fall in the number of red corpuscles resulting in a slight anaemia with an average haemoglobin rate ranging from 11.7% to 2.145%.

A further slight increase was observed at the leucocytes side ranging 5,853 to 5,932 with an average lymphocyte percentage rise ranging from 35.34% to 44.70%.

It was found that an improvement of the patients' body defence system was under way.

### Function of the Hepatic System

The average transaminases and SGOT and average SGPT increased in number indicating a change in this system( 34 IU/L to 40 IU/L).

The median glycaemia got stabilized.

The average triglycerides also dropped from 1.5g/l to 0.82g/l.

There also a slight rise in the blood cholesterol level (from 0.95g/l to 1.38g/l.)

It was found that the hepatic system was getting slightly bad.

**It must be noted that that area is known for the consumption of locally distilled alcohol.**

### ***Function of the kidney system***

The average creatinine slightly rose from 8.52mg/l to 9.09mg/l

The kidney system was within the norms (7mg/l – 12mg/l)

# Background: Bioelectric Impedance Analysis, A New Index for Modern Health Evaluation

## Importance of BIA Parameters

**American Journal of Clinical Nutrition, Vol 64, 524S-532S, 1996**

**Bioelectrical impedance analysis  
in body composition measurement:**

**National Institutes of Health  
Technology Assessment Conference  
Statement**

**The objective of this conference was to provide physicians with a responsible assessment of bioelectrical impedance analysis (BIA) technology for body composition measurements.**

**The panel concluded that BIA provides a reliable estimate of total body water under most conditions. It can be a useful technique for body composition analysis in healthy individuals and in those with a number of chronic conditions such as mild-to-moderate obesity, diabetes mellitus, and other medical conditions in which major disturbances of water distribution are not prominent.**

**Therefore, the panel recommends that a committee of appropriate scientific experts and instrument manufacturers be formed with the goal of setting instrument standards and procedural methods.**

## **Development of bioelectrical impedance analysis prediction equation for body composition with the use of a multicomponent model for use in epidemiologic surveys 1,3,4**

Background: Previous studies to develop and validate **bioelectrical impedance analysis (BIA)** equations to predict body composition were limited by small sample sizes, sex specificity, and reliance on reference methods that use a 2-component model.

**Conclusion:** These equations have excellent precision and are recommended for use in epidemiological studies to describe normal levels of body composition.

**J Acquir Immune Defic Syndr Hum Retrovirol. 1995 May 1;9(1):20-5. Bioelectrical impedance analysis as a predictor of survival in patients with human immunodeficiency virus infection.**

Ott M, Fischer H, Polat H, Helm EB, Frenz M, Caspary WF, Lembcke B

Division of Gastroenterology, University Hospital, Johann Wolfgang Goethe University, Frankfurt, Germany.

In patients with AIDS, short-term survival has been related to body weight, body composition, and serum nutritional parameters, but their prognostic impact at earlier stages of the HIV infection is not known. With an individual follow-up period of 1,000 days, we investigated the prognostic relevance of electrical tissue conductivity [resistance R, reactance Xc, phase angle alpha, extracellular mass (ECM), body cell mass (BCM)] measured by bioelectrical impedance analysis, of the CD4+ cell count, and of serum parameters indicating malnutrition in 75 HIV-infected male patients at Walter Reed stages 3-5. After initial recording, 29 patients (38.7%) died from AIDS during this period. Among 12 parameters estimated with a semiparametric Cox regression model adjusted for therapy (pentamidine, azidothymidine), the phase angle alpha (parameter estimate: -1.043, 95% confidence interval of -0.61 to -1.47;  $p < \text{or} = 0.0001$ ), the ECM/BCM ratio, Xc, BCM, serum cholesterol, number of CD4+ cells, and serum albumin had significant prognostic influence on survival, whereas age, body weight, body mass index, resistance, serum protein, and serum triglycerides did not. In a model with four covariates (CD4+ cells, phase angle, pentamidine, azidothymidine), the prognostic impact of the CD4+ cell count (parameter estimate: -0.549) was lower compared with the phase angle alpha (parameter estimate: -0.799;  $p < \text{or} = 0.0001$ ) and did not gain statistical significance ( $p = 0.0626$ ).

**The phase angle alpha was the best single predictive factor for survival among all 12 parameters** (comparison of the respective Cox models with the likelihood ratio test).

**Am J Clin Nutr. 2000 Aug;72(2):496-501.**

**Phase angle from bioelectrical impedance analysis remains an independent predictive marker in HIV-infected patients in the era of highly active antiretroviral treatment.**

**Schwenk A, Beisenherz A, Römer K, Kremer G, Salzberger B, Elia M.**

**Klinik I für Innere Medizin der Universität zu Köln, Cologne, Germany.**

**BACKGROUND:** Highly active antiretroviral treatment (HAART) reduces the risk of wasting in HIV infection and may alter the prognostic weight of wasting. The phase angle from bioelectrical impedance analysis (BIA) can be interpreted as a surrogate marker for the catabolic reaction to chronic HIV infection and opportunistic disease. **OBJECTIVE:** Our objective was to assess the prognostic ability of the phase angle in HIV-infected patients in the era of HAART. **DESIGN:** Two cross-sectional observation studies were conducted in 1996 and 1997 at a German university outpatient HIV clinic. In the 1996 and 1997 cohorts, HAART was prescribed to 17 of 212 and 168 of 257 patients at baseline and to 179 of 212 and 234 of 257 patients during observation, respectively. Whole-body BIA was assessed at 50 KHz. Time to clinical progression and survival were calculated by using Cox proportional hazard models with time-dependent covariates. Median observation times were 1000 and 515 d for the 1996 and 1997 cohorts, respectively. **RESULTS:** Higher phase angle was associated with a lower relative mortality risk, adjusted for viral load and CD4(+) cell count, of 0.49 (95% CI: 0.30, 0.81) per degree in 1996 and of 0.33 (95% CI: 0.18, 0.61) in 1997. The influence of phase angle on time to clinical progression, adjusted for viral load and CD4(+) cell count, was not significant in 1996 but the relative risk was 0.58 (0.36, 0.83) in 1997.

**CONCLUSION:** Despite the favorable effects of HAART on the nutritional status of HIV-infected persons, low phase angle remains an independent adverse prognostic marker of clinical progression and survival.

**J Nutr. 2001 Nov;131(11):2843-7.**

**Severity of human immunodeficiency virus infection is associated with decreased phase angle, fat mass and body cell mass in adults with pulmonary tuberculosis infection in Uganda.**

**Shah S., Whalen C., , Kotler DP., , Mayanja H., Namale A., Melikian G., Mugerwa R, Semba RD.**

**The Children's Hospital of Philadelphia, University of Pennsylvania, Philadelphia, PA, USA.**

Although coinfection with tuberculosis and human immunodeficiency virus (HIV) is emerging as a major problem in many developing countries, nutritional status has not been well characterized in adults with tuberculosis and HIV infection. We compared nutritional status between 261 HIV-positive and 278 HIV-negative adults with pulmonary tuberculosis in Kampala, Uganda, using anthropometry and bioelectrical impedance analysis. Among 163 HIV-positive and 199 HIV-negative men, intracellular water-to-extracellular water (ICW:ECW) ratio was  $1.48 \pm 0.26$  and  $1.59 \pm 0.48$  ( $P = 0.006$ ) and phase angle was  $5.42 \pm 1.05$  and  $5.76 \pm 1.30$  ( $P = 0.009$ ), respectively. Among 98 HIV-positive and 79 HIV-negative women, ICW:ECW was  $1.19 \pm 0.16$  and  $1.23 \pm 0.15$  ( $P = 0.11$ ) and phase angle was  $5.35 \pm 1.27$  and  $5.43 \pm 0.93$  ( $P = 0.61$ ), respectively. There were no significant differences in BMI, body cell mass, fat mass or fat-free mass between HIV-positive and HIV-negative adults. Among HIV-positive subjects, BMI, ICW:ECW, body cell mass, fat mass and phase angle were significantly lower among those with CD4(+) lymphocytes  $\leq 200$  cells/ $\mu\text{L}$  compared with those who had  $> 200$  cells/ $\mu\text{L}$ . In sub-Saharan Africa, coinfection with pulmonary tuberculosis and HIV is associated with smaller body cell mass and intracellular water, but not fat-free mass, and **by large differences in ICW:ECW and phase angle alpha.**
